

Application of Digital Humans in Workstation Design

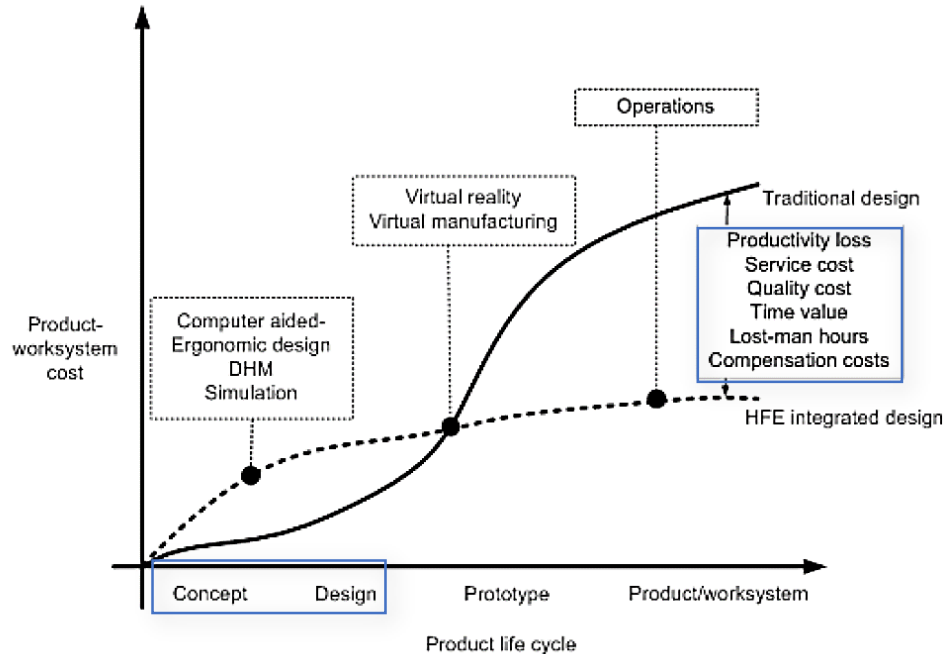

Presented b: Gus Arroyo, MS, CPE, ASP

What is Digital Human Modeling (DHM)?

Process of developing digital human models using anthropometric and biomechanical database, for ergonomic evaluation of product, process and workstation in virtual environment

Why Use DHM?

What is Santos?

- **An Anatomically Correct Human in a Virtual World**
 - **Create digital human models** with realistic appearance and biomechanical fidelity
 - **Simulate endless series of scenarios** to test human-system interactions
 - Comprehensive toolkit set to **analyze human performance and biomechanical stress**

Basic Functions

What Can Santos Do?

- Clearance and reachability
- Vision
- Obstacle avoidance
- Egress analysis
- Strength requirements
- Static fatigue
- MSD/injury risk (NIOSH limits)

Shoe Manufacturing

Problem Statement

Press Machine in Shoe Insole Production

- **Client Request**

- Need quantitative assessment to support buy-in from leadership for redesign
- Multiple incident reports
- Need data for current design and proposed design

Task Simulation and Analysis

Conditions

Range of
anthropometric
models

From ground
level to 7"
platform

Various duty
cycles

Metrics

Outcome

- **Equipment and task specific data to drive solutions – no general guidelines**
 - Height and repetition ranges within “safe limits”
 - Optimal height suggestion to minimize spinal loading and arm fatigue
- **No employee needed to recreate task or replicate “worst case” scenarios**
- **Testing redesign variations without expensive prototypes or ongoing consultant support**

Pharmaceutical Industry

Problem Statement

Shipping/Receiving in Pharmaceutical Industry

- **Client Request**

- Injury reports linked to material handling tasks
- Need assessment to support purchase of material handling lift tables
- Evaluate effectiveness of current interventions e.g., biomechanics training

Task Simulation and Analysis

Conditions

Different
anthropometric
models

Various common
lifting postures

Risk data when
introducing
interventions

Outcome

- **Client has quantitative data to support purchase of new equipment**
- **Assessment not limited to current workforce or task conditions**
 - Postures that cannot be assessed with traditional ergo tools were evaluated (i.e., golfer's lift)
 - People of different heights were simulated
 - Highlighted loads that exposed employees to highest risk
- **Simulations provide visual aid for training purposes**

Robotics (WIP)

BSI Always Striving for Innovation

Robot-Human Interface

- **BSI is investigating how to better conduct ergonomic analysis of robot-human interfaces:**
 - Can human resist force from a robot?
 - Can human work safely outside robot envelopes?
 - Can human reach critical system controls e.g. EMO?

External Loading Effects on Joint Strength

Force from Robotic Arm= 130 N (ISO/TS 15066 MPF for head)

But loads are dynamic..

Lower neck joint for extension most affected. They require 83.9% of max force to resist external force. Working near/at/above maximum joint torque may result in muscular strain.

Neck				
Lower L./R. Bending	100%	16.9%		100%
Lower Extn./Flex	100%	49.7%		100%
Lower R./L. Rot	100%	-51.3%		100%
Upper L./R. Bending	100%	17.5%		100%
Upper Extn./Flex	100%	29.4%		100%

Neck				
Lower L./R. Bending	100%	83.9%		100%
Lower Extn./Flex	100%	44.4%		100%
Lower R./L. Rot	100%	28.3%		100%
Upper L./R. Bending	100%	55%		100%
Upper Extn./Flex	100%	31.6%		100%

% Neck Strength (% of task strength/ maximum strength)

Emergency Components

E-Stop and Light Tower

Reaching Capabilities

Right Shoulder Max Reached

Visual Acuity

Loading/Unloading

Joint Strength (% of task/max)

Spine				
Low L./R. Bend	-130.2	42.3	110.4	
Low Extn./Flex	-303.5	-145.4	163.7	
Low R./L. Rot	-66.9	-2.7	66.7	
High L./R. Bend	-146	33.9	93.9	
High Extn./Flex	-292.9	-111	248.5	
High R./L. Rot	-66.8	-7.1	69	
Shoulders				
R. Abd./Add.	-57.6	-7.7	60.4	
R. Extn./Forward Flex	-90	36.9	72.1	
R. Int./Rot/External Rot	-17	4.3	35.7	
L. Abd./Add.	-45	-18.2	54.9	
L. Extn./Forward Flex	-83	26.6	71.1	
L. Int./Rot/External Rot	-18	1.8	35.3	
Arms				
R. Elbow Flex/Extn.	-55.9	-12.5	38	
R. Wrist Pro./Supination	-6	-2.2	8.1	
R. Wrist Rad./Ulnar Dev.	-13	6.3	13.2	
R. Wrist Extn./Flex	-7.7	-6.1	13.7	
L. Elbow Flex/Extn.	-54.5	2.2	35.3	
L. Wrist Pro./Supination	-6	-4	8.1	
L. Wrist Radial/Ulnar Dev.	-13.3	4.6	11.7	
L. Wrist Extn./Flex	-7.4	-6.5	13.8	

Benefits of DHM

This is not the future, this is now

- **Protect Workers:** The ability to use digital humans instead of humans in current or potential high-risk environments
- **Save Time:** Reduce the amount of time from redesign efforts and evaluations
- **Save Cost:** By decreasing the amount of physical prototypes needed, onsite evaluation time, and likelihood of expensive work injuries
- **Improved Human-Machine-Interaction:** By bringing the human into the loop during the design or design phases

Stuck in the Box: Challenges in Glovebox Ergonomics

Presented by: Martha Chan
Ergonomist at Los Alamos National Laboratory

Overview

- **Specialty ergo**
- **What is a glovebox?**
- **How did we get started?**
- **How are we keeping this going?**
- **What is on the horizon...**

Ergonomics

Fitting a job to a person!

Productivity and comfort

MSD injury and human error risk

Specialty Ergonomics

What is a glovebox (GB)?

- **Containment units used to protect workers from material or material from worker**
- **Atmosphere inside**
 - Positive or negative pressured
 - Filled with different gases
- **Can be single units or multiple units linked**
- **Houses various equipment, chemicals, and materials**

Glovebox

Ideal Glovebox Worker

- Overall Height: 5'10"(178cm) (**Female 95th / Male 60th**)
- Arm Length: 28" (**Female 95th / Male 65th**)
- Shoulder Width: 18" (**Female 99th / Male 85th**)

How did we get started?

- **A physical therapist who is very tenacious and practical**
 - Many shoulder and elbow injuries in the same area of work – what is happening?
- **Started with partial funding for one ergonomist**

High risk for GB ergo injuries (Top 5)

Shoulder and Elbow: \$\$\$

- **Highest severity: surgery and career ending**
- **Highest frequency: 2012-2020 - 14 shoulders & 18 elbows**

Down from 2004-2012 - 24 shoulders & 37 elbows

- **Most costly:**

Shoulder surgery direct and indirect cost ~ \$120,000 to \$200,000 (LANL 2014)

Elbow surgery direct/indirect cost ~ \$100,000 (LANL 2014)

GB Worker Survey

Percentage of Workers Reporting Symptoms
vs.
Years as a Glovebox Worker.

How are we keeping it going?

- **Developing custom solutions**
 - Lots of worker engagement
- **Involvement in safety programs**
- **Ergo demonstration room near workers**
- **Provide data-driven GB ergo guidance**
- **Integration into new or retrofit GB planning**
- **Glovebox worker ergonomics training**
- **Sharing ideas with other Department of Energy sites and glovebox users via American Glovebox Society**

Engineering Solutions

Retractable shelf for airlock

New glovebox glove mold

Push/Pull Reach
Tool

Functional Work Space

Horizontal Reach Zones: distance from the gloveport ring toward the back of the glovebox

22"-26" TERTIARY ZONE

15"-22" SECONDARY ZONE

9"-11" IDEAL ZONE

4"-15" PRIMARY ZONE

0"-4" AVOID

Y12

NATIONAL SECURITY COMPLEX

NISA

Computer simulation

Identifies clearly the viewing by the operator

Ergonomics Design Toolbox

- **Anthropometry**
- **Ergonomic Guidelines**
 - ACGIH
 - RULA
 - Many more
- **Computer Simulation**
- **INVOLVE THE OPERATORS!**

Ergonomic Work Habits Toolbox

- **Avoid Awkward Postures**
- **Proper Ergonomic Movements/Positions**
- **Mini-Breaks**
- **Gentle Stretches**

Resources for GB ergo

SHOULDER BEST PRACTICES

Removing arms from glovebox gloves

- Pull fingers free
- Extract with elbow angled down -improve: muscle imbalances

Lots of outreach in the GB world

AGS Webinar Series
Stuck in the Box - Challenges in Glovebox Ergonomics

Glovebox present unique ergonomic challenges as result of their physical features and non-adjustable. Lisa Chan, Human Factors Manager (AGS) at Protonix, has over 100 gloveboxes from tanks with 40 glovebox workers performing manufacturing work inside gloveboxes for much of their work days. She's ready. AGS's ergonomics team has a specialized glovebox functioning and 11 unique ergonomic tools that gloveboxes present. This presentation will focus on how a specialty ergonomics program via glovebox ergonomics can come to the fore, including working from developing ergonomics issues in gloveboxes to managing a steady production program. From engineering solutions and worker training developed through this glovebox ergonomics program will be shared during presentation.

Meet The Speaker
Martha Chan
Martha Chan is an experienced for LSA, Human Factors Manager, specializing in glovebox ergonomics. She holds a master's in Human Factors and Systems Engineering. Martha is a certified Associate Ergonomics Professional and a member of AGS since 2016.

Webinar Pricing
AGS MEMBERS:
Full Series: \$110
Individual Webinar: \$75
NON MEMBERS:
Full Series: \$230
Individual Webinar: \$125
JUNE 15, 2016 9:00 AM
Webinar will be recorded and will be available on demand.

About This Webinar Series
This webinar series has been developed to provide AGS members with the glovebox and related industry information will be held on November 17th and November 24th. Topics include:
Stuck in the Box - Challenges in Glovebox Ergonomics
Overcoming the Stuck in the Box - Challenges in Glovebox Ergonomics
Lisa Chan, Human Factors Manager
Stuck in the Box - Challenges in Glovebox Ergonomics
Lisa Chan, Human Factors Manager

AGS
American Glovebox Society
Register Online:
GloveboxSociety.org

What is on the horizon...

- **Symptoms survey #2**
- **Increase use of modern computer technology for evaluations: simulation, virtual, and augmented reality**
- **Expanding connections!**
 - With other specialty ergo program to share ideas
 - With other companies that have glovebox work
 - With other glovebox workers

Happy Glovebox Workers
